This 10-year-old boy attends for assessment:

Radiographs reveal a tuberculate supernumerary tooth in the upper left central incisor region.

As well as removal of the upper left deciduous incisor tooth, what is the most appropriate plan for management of this patient?

A. creation of space for the unerupted upper left central incisor, followed by a period of monitoring
B. removal of the supernumerary tooth and immediate bond and traction to upper left central incisor tooth
C. removal of the supernumerary tooth and creation of space for the unerupted upper left central incisor tooth, followed by a period of monitoring
D. creation of space followed by removal of the supernumerary tooth and immediate bond and traction of the upper left central incisor tooth
E. removal of the supernumerary tooth and creation of space followed by bond and traction to upper left central incisor tooth

Correct Answer:  D
